

Copying and Moving pages

Requirement Yogi is generally built to support copying and moving.

	Copy	Move
Product Requirement Document blueprint, Dictionary blueprint, or any page with requirements.	 If you copy pages with requirements, then you end up with 2 definitions of the same requirement. <ul style="list-style-type: none">• Replace definitions with links,• Or copy the page to another space.	 If you move to another space, the URL of the requirements it contains will change. <ul style="list-style-type: none">• All pages referencing those requirements will be updated,• JIRA issues will only be updated at the next synchronization (or immediately if you've configured your integration with immediate sync).• A redirect will be created between the old URL and the new URL.
Baselines	 The copy will be reset, so you can freeze it whenever you want.	 If you move a baseline, it will keep all its properties and frozen requirements.
RY Test Session blueprint	 The copy will have all tests in the same status as the source page.	

As a rule, if you feel like the requirements were not properly indexed, either edit the page or go to the tools menu, at the top-right of the page:

Just going to this page will check that requirements exist and aren't duplicated. You can also click "Refresh requirement descriptions" and even use this screen to transform all references to those requirements on the space to actual links!

Requirement Yogi Info

Summary:

- 3 requirements on the page,
- including 2 requirement definitions,
- and including 1 links to requirements.

Operations

Refresh options Also replace all occurrences in space

Search in the text of the whole space for requirement keys of this page, and transform them into a Requirement Yogi macro.

Refresh requirement descriptions

Descriptions are updated the first time the page is viewed. This button clears the descriptions and goes back to view the page to have them updated.

Links with JIRA

There are no issues on this page with a link to JIRA. Go to JIRA to create links!
